US-2000 CSW Cornerline for Graphics

The US-2000 CSW-DMS Corner Line for Graphics is used in conjunction with a paper cutter to band random sized stacks. The operator slides a row of product onto the infeed conveyor. The individual stacks are pushed at 90 degrees to the infeed direction by a servo-pusher that measures the product length. Single or multiple bands are applied based on the criteria set by the operator. Short products are banded once. Longer products receive multiple bands. Stationary or pneumatic guides can be added to the system to ensure that the product is aligned properly before the band is applied.
