US-2000 Transit Line SW

The US-2000 Transit Line SW is designed for product streams with uneven spacing between products or for stacks of slippery products where stack integrity is lacking. The products are accumulated at the infeed and are separated so that each product can be banded. The separation conveyor also transitions the speed of the product stack to prevent shingling. Stationary or pneumatic guides can be added to the system to ensure that the product is aligned properly before the band is applied.
